

Lab 4, Nov. 5-16, Practice Questions

Defining and Testing Simple Java Classes

Complete the declarations of the incomplete Java classes posted under “Incomplete Java classes”, according to the specification written in the comments. Then write a test class for each of them (write the testing code in method main()). The test class should include at least one test case for each method (more cases for the methods where multiple situations should be tested). For each test, the message printed should state clearly what method is tested and what situation is tested – when there are special cases).
